

The new Heelift® Glide Suspension Boot by DARCO

For prevention and healing of open wounds and decubitus

HEELIFT®
Glide
SUSPENSION BOOT

New forefoot strap for
better support!

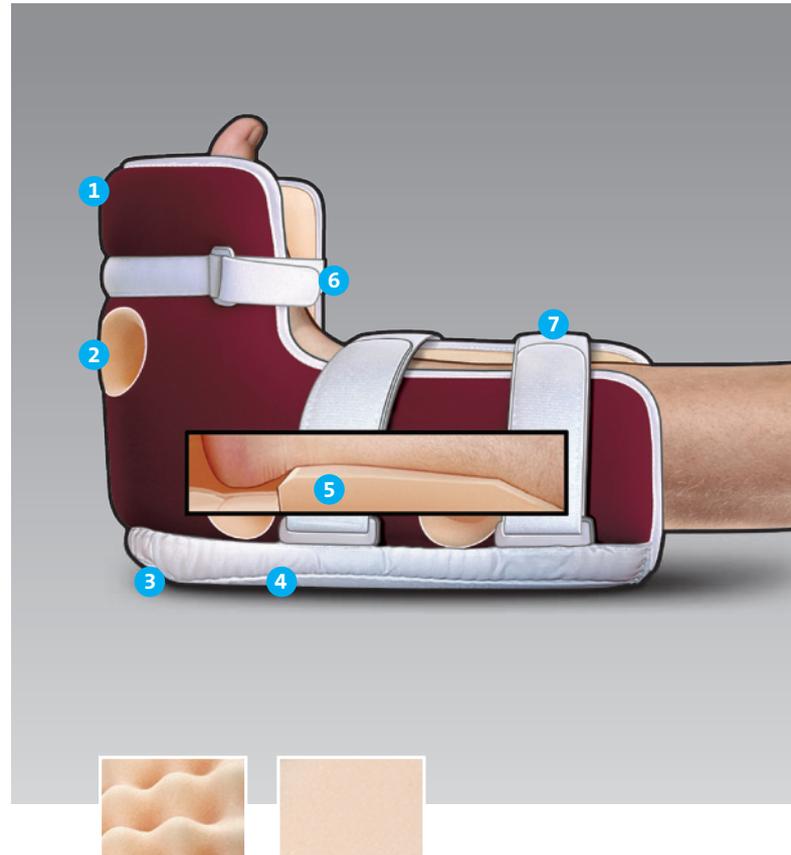

- > for the prevention and treatment of heel pressure ulcers, diabetic foot syndrome and decubitus
- > diabetes with neurological sensory deficit
- > prolonged immobility or coma
- > 40% lighter, cooler and less bulky than a pillow-style boot

DARCO

What makes the Heelift® Glide the right boot for your patient?

- 1 **Durable Exterior** allows the patient's leg to glide easily across bed sheets.
- 2 **Ventilation Holes** provide additional air circulation to promote increased patient comfort.
- 3 **Heel Suspension Opening** allows for visual inspection of the heel.
- 4 **Friction-free Tricot Backing** aids in patient mobility and helps ensure patient safety.
- 5 **Affixed Elevation Pad** lifts the leg to suspend the heel, promoting the ideal environment for an ulcer to heal.
- 6 **Forefoot Strap** keeps the boot in place and helps support the forefoot.
- 7 **Soft »easy-on, easy-off« Closure Straps** are a simple solution for a custom fit.

Heel off-loading and pressure ulcer prevention

The Heelift® Glide Suspension Boot provides effective pressure relief in the heel area and also prevents heel ulcers. We incorporated feedback from doctors and patients into the development of the Heelift® Glide so that the resultant suspension boot features all of the desired criteria.

Why is the Heelift® Glide so unique?

A soft, smooth fabric cover allows the leg to »glide« from one side to the other so that it does not get caught on the bed sheet or cover. An additional forefoot strap secures the foot and helps support the forefoot.

That means:

- > the foot stays in the proper position
- > less nursing time is needed to reposition the patient
- > heel pressure ulcer prevention is maximized

Because proper fit is crucial to the success of the prevention and treatment program, Heelift® Glide is available in three sizes.

Choice of two interiors

The standard version of the special foam material construction allows better air circulation. The attached nubs provide a pleasant cooling effect.

The smooth foam material was developed especially for patients with sensitive skin. This helps prevent the formation of oedema. This version is recommended for diabetic patients.

Item-No.	Colour	Size (Calf circumference)
----------	--------	---------------------------

Heelift® Glide Standard (convoluted foam):

DM-HLPG	Red	Petite (15 – 25 cm)
DM-HLG	Red	Normal (20 – 36 cm)
